

Why go for Nebula Cloud-managed Networking?

Here are 10 good reasons for you.

Internet connectivity has become a must to everyone in offices, schools, hospitals, hotels and retail stores. The first question that comes up for organizations expanding the geographic coverage of their business is how to provide Internet services quickly, effortlessly and economically with next-generation security protection; then the second is how to manage multi-site networks containing hundreds of networking devices with only limited IT resources and budgets.

The Nebula cloud networking and management solution offers everything you need to build a network as well as to operate and manage devices, users and networks across multiple locations and buildings – all under a single interface. The intuitive management interface provides full network visibility with real-time alerts to keep you in total control of the entire network.

- 1 Zero-touch hardware provisioning** for rapid deployment. The Nebula wired and wireless products can perform auto-configuration after installation and can be deployed even by non-IT professionals.
- 2 Nebula mobile app** with a build-in QR code scanner that quickly claims a large number of devices to the Nebula control center all at once.
- 3 Centralized remote management** that manages and monitors hundreds of distributed branch sites with a single pane of glass.
- 4 Comprehensive product portfolio** from wired, wireless to security, which are built from the ground up for cloud management.
- 5 Real-time and historical activity views** with 24x7 monitoring over as long as the past 6 months and thousands of dispersed networks, devices and users.
- 6 Over-the-web updates** that enables firmware and security signature updates to be delivered seamlessly over the cloud.
- 7 Multi-tenant role-based administration** for supervisors of different organizations to assign different privileges for multiple administrators to manage networks and guest access.
- 8 Standard-based, limitless and flexible scalability** provides the reliable, elegant and efficient benefits of non-proprietary secure network control. The amount of hardware that Nebula can handle is basically unlimited, so networks can grow and change to suit your needs.
- 9 Credit-based and affordable licensing model** allows you to optimize IT budgets according to your business dynamics.
- 10 Enterprise-grade security** with authentication and encryption, management data/connection loss prevention, firewall implementation and privacy protection is included to protect your Nebula networks.
